

Lexer

TEXT tag and attribute must conform to the XML element naming rules:

1. must start with a letter or underscore
2. cannot start with the letters xml (or XML, or Xml, etc)
3. can contain letters, digits, hyphens, underscores, and periods

QUOTE content is trimmed according to these rules:

1. Any leading/ending (space|cr|tab)* nl (space|cr|tab)* is removed.
2. Incidental whitespace will always be trimmed, when there is at least one nl left.

QUOTES can combine multiple QUOTE(s):

1. A suffix \ joins the next QUOTE seamlessly.
2. A suffix \n inserts a newline before joining.

Joining children inside the xmq rule:

1. All children are joined seamlessly.
2. Except two consecutive QUOTE are joined with a newline.

Pretty printing introduces whitespace for div{a{span=' hi '}}

1. Default XML output will insert newlines+indentation.

```
<div>
  <a>
    <span> hi </span>
  </a>
</div>
```

2. Default HTML output will prevent newlines+indentation next to known inline elements where whitespace is significant.

```
<div>
  <a><span> hi </span></a></div>
```

3. The option --nopp will prevent all pretty printing and this can be necessary when the DTD/CSS has tailored significant whitespace.

```
<div><a><span> hi </span></a></div>
```
